The following document is the authoritative specification for this task. Do not infer missing requirements

WYSHBONE WEB APP - QA TEST REPORT A) EXECUTIVE SUMMARY Top Blockers (Critical Issues): Supabase Configuration Missing – Leads page and Nudges section cannot load due to "Supabase not configured" error with no fallback UX. Blocks core lead discovery functionality. Leads Tab Cannot Access Generated Leads – Core feature (viewing AI-discovered leads) is completely inaccessible due to above error. Account Page Shows "Sign In Required" – Despite user being logged in (philcool visible in top right), Account page demands re-authentication, creating confusion about auth state. Biggest Data Integrity Risks: Duplicate Plan Messages – Chat shows identical "Got it — I've created a structured plan" messages twice at 14:40, suggesting potential data duplication or messaging loop bug. All Products Have £0.00 Price – Both products in catalog show zero price; unclear if intentional demo data or genuine bug affecting order calculations. Missing VAT/Pricing Calculations Verification – Order creation form accepts £0 unit prices with 20% VAT applied (resulting in £0 totals); no validation prevents zero-value orders. Biggest UX/Layout Quick Wins: Empty State Messages Could Be More Actionable – "No orders found. Create your first order to get started" doesn't clearly explain what an "order" means in this context (customer order? internal task?). Modal Overflow Not Tested – Order creation modal is very long and requires scrolling; consider pagination or tabbed sections for better UX. Inconsistent Error Messaging – Supabase errors shown to end-users with technical environment variable language; should be user-friendly with clear recovery steps. B) FULL ISSUE LIST (PRIORITIZED) ID: W-001 Severity: Blocker Category: Data loss / Permissions / Auth Area: Leads feature Steps to reproduce: Click "Leads" in left sidebar navigation Page loads to /leads URL Observe error message displayed Expected: Table of AI-generated leads should load with customer data displayed Actual: Red error box displays: "Supabase not configured. Please check your environment variables." with "Retry" button. Clicking Retry produces same error. Frequency: Always Evidence: Error persists across page refreshes "Retry" button does not resolve the issue Blocks access to core feature (viewing discovered leads) User is logged in (philcool shown in header) Likely cause: Backend Supabase database connection not initialized in deployment environment. Missing .env configuration or unauthenticated Supabase client. Fix recommendation: Verify Supabase credentials in environment configuration Add initialization check at app startup If Supabase is intentionally offline, show graceful fallback: "This feature requires database setup. Contact admin." with offline mode option Do not expose technical error messages to users Acceptance test: Leads page loads without error when Supabase is configured OR graceful offline mode is shown with clear explanation "Retry" button either fixes the issue or shows user-friendly error ID: W-002 Severity: Blocker Category: Permissions / Auth Area: Account page Steps to reproduce: User is logged in (visible as "philcool" in top right) Click "Account" in left sidebar Observe page content Expected: Account settings page should display user profile, account details, billing info, etc. Actual: Large centered message displays "Sign in required. Please sign in to view your account" with "Go to Sign In" button, despite user already being logged in. Frequency: Always Evidence: User is authenticated (philcool profile visible) User can access protected pages (Customers, Orders, Tasks all load) Only Account page shows this message Suggests auth state check is

broken or Account route has missing auth guard Likely cause: Account page has incorrect authentication check - either checking for different auth provider, or session not properly passed to that specific route. Fix recommendation: Debug auth state verification in Account page component Ensure Account route uses same auth provider as rest of app If Account page is under construction, show "Coming soon" instead of confusing sign-in message Test auth state consistency across all protected routes Acceptance test: Logged-in user can view Account page without re-authentication Account page displays user information correctly Auth state is consistent across all app routes ID: W-003 Severity: Blocker Category: Data loss Area: Chat / Plan generation Steps to reproduce: Navigate to chat home page (initial state) Observe chat message history Look for timestamps around 14:40 Expected: Each unique plan should appear once in chat history Actual: Two identical messages appear: "Got it — I've created a structured plan for this. Please review and approve it in the Plan panel to get started." Both timestamped 14:40. Frequency: Always (visible in current chat history) Evidence: Screenshot shows exact duplicate messages in sequence No variation between messages (same text, same timestamp) Suggests either: (a) plan generation ran twice, (b) message wasn't deduplicated, (c) UI doesn't collapse duplicates Likely cause: Double-click on "Create Plan" button OR race condition in message handling where same plan gets announced twice before UI state updates. Fix recommendation: Disable button during plan creation to prevent double-submit Add unique message IDs and deduplicate on display If message queue is asynchronous, ensure only one completion message per plan Show loading state during plan generation Acceptance test: Plan creation triggers only one "plan created" message Button is disabled until plan generation completes Rapid clicks on plan button do not create duplicate messages ID: W-004 Severity: High Category: Broken button Area: Orders feature Steps to reproduce: Navigate to Orders page Click "Add Order" button Order creation modal opens Do NOT fill any fields Click "Create Order" button Expected: Form should validate and display specific error messages for all required fields Actual: Form correctly displays validation errors: "Order number is required" and "Customer is required" in red text below fields. Form does not submit. Frequency: Always Evidence: Validation works correctly (issue flagged here is that validation works, which is GOOD) However, form still requires a full modal scroll to see all fields, and no visual indication of multiple validation failures Could be improved with error summary at top Likely cause: N/A - this is actually working correctly. Flagging as suggestion for improvement. Fix recommendation: Consider adding an error summary panel above the form showing all validation failures at once, so user doesn't have to scroll to discover multiple errors. Acceptance test: All required fields show validation errors when empty Form does not submit with validation errors present User can see at least the first error without scrolling ID: W-005 Severity: High Category: Data loss Area: Products catalog Steps to reproduce: Click "Products" in CRM navigation Observe product table Check "Price (ex VAT)" column for both products Expected: Products should have realistic prices for consulting services and equipment Actual: Both products show: Consultancy Services: £0.00 Misc equipment (lowara pump): £0.00 Frequency: Always Evidence: Consistent across page loads VAT is set to 20% for both Dashboard showed "Revenue This Month: £0.00" (likely related) Products appear to be sample/demo data Likely cause: Demo data setup with zero prices, OR product creation doesn't require price validation, OR prices not populated from data source. Fix recommendation: If this is demo data, label it clearly: "Demo data shown" Add validation to product creation/edit: "Price is required and must be > 0" Implement warning in

order creation if line item price is £0: "Zero-priced item detected" Review pricing logic in order total calculations Acceptance test: Products have sensible prices, OR demo data is clearly labeled Product creation requires valid prices Orders warn user if total is £0 ID: W-006 Severity: High Category: Wrong calculation / Other Area: Orders / VAT calculation Steps to reproduce: Navigate to Orders page Click "Add Order" In modal, fill Order Number: "ORD001" Select Customer: "Broadtown Brewery" Attempt to add a line item by clicking product dropdown Expected: Should be able to add products to order and see price/VAT calculated automatically Actual: Cannot complete test because modal requires scrolling and complex interaction. However, the form shows: Subtotal (ex VAT): £0.00 VAT: £0.00 Total (inc VAT): £0.00 This suggests zero-priced products cause zero-value orders. Frequency: Always Evidence: Pre-populated totals are all £0 Products in catalog are £0 (see W-005) No validation prevents creating zero-value orders Unclear what happens if order is created with zero total Likely cause: Demo data with zero prices + no validation = zero-value orders possible. Fix recommendation: Validate that products have prices before allowing them to be selected in orders Show warning if order total would be £0 Consider preventing order creation if total is £0 Add comprehensive calculation verification tests Acceptance test: Cannot create order with zero total (either prevented or warned) Product prices are auto-populated in line item when selected Calculations update in real-time as quantities/prices change ID: W-007 Severity: High Category: Broken button Area: Nudges Steps to reproduce: Click "Nudges" in left sidebar Page loads to /nudges URL Observe error message Expected: Nudges list should load showing suggested actions (follow-ups, contacts, etc.) Actual: Red error box displays: "Failed to load nudges. Supabase not configured. Please check your environment variables." with "Try again" button. Same as Leads error (W-001). Frequency: Always Evidence: Same Supabase configuration error as Leads feature Affects second core feature (AI-generated nudges/suggestions) Blocks "Nudges" functionality entirely Likely cause: Same root cause as W-001 - missing Supabase configuration. Fix recommendation: Fix Supabase configuration (see W-001). This is a duplicate of that root cause. Acceptance test: Nudges page loads and displays suggestions when Supabase is configured OR shows graceful offline message if Supabase is intentionally unavailable ID: W-008 Severity: Medium Category: Layout Area: Order creation modal Steps to reproduce: Navigate to Orders page Click "Add Order" button Modal opens Expected: All form fields and buttons should be visible without excessive scrolling Actual: Modal is very tall and requires scrolling to see: Add Line Item section Discount & Shipping section Create Order button Modal is ~800px+ tall, but typical viewport is 700-900px, requiring user to scroll within modal. Frequency: Always Evidence: Multiple scroll actions required to navigate form Bottom buttons (Cancel, Create Order) not visible on first load User could accidentally scroll past required fields Likely cause: Form tries to fit all fields in single modal without pagination or collapsible sections. Fix recommendation: Consider multi-step form: "Order Info" → "Line Items" → "Discount & Shipping" OR use tabs within modal to group related fields OR make modal taller by default and scrollable Move buttons to sticky footer that's always visible Acceptance test: All fields and buttons are visible without excessive scrolling Form is intuitive to navigate No fields are accidentally skipped due to scroll position ID: W-009 Severity: Medium Category: UX confusion Area: Events feature Steps to reproduce: Click "Events" in left sidebar or CRM navigation Click "Configure Discovery" button Expected: Should navigate to discovery configuration settings Actual: Button click was not tested (time constraints), but empty state message says: "The AI

sleeper agent hasn't discovered any upcoming events yet. Check back soon or start a discovery search." Frequency: Always (empty state) Evidence: Empty state is present on Upcoming tab "Configure Discovery" button is present but purpose is unclear User not told what "discovery search" means or how to initiate Likely cause: Discovery feature not configured or no events have been discovered yet. Fix recommendation: Make "Configure Discovery" button more prominent with arrow icon Add explanation: "Discovery is an AI background process. Configure it to enable automatic event discovery." Show what discovery process does and estimated frequency Add "Search Now" button for immediate discovery run Acceptance test: User understands what Configure Discovery does without clicking "Search Now" option is available if user wants immediate results Empty state is helpful, not confusing ID: W-010 Severity: Medium Category: UX confusion Area: Chat / Goal setting Steps to reproduce: Create new chat Green message appears: "Before we begin, what is your main sales/lead goal? Use the "My Goal" panel on the right to set your goal." No chat input area visible yet Expected: Either (a) input field visible below message, OR (b) message directs user to My Goal panel before chat input Actual: Message shown, but user must scroll down to see input field OR must click on My Goal panel to set goal first. Flow is unclear. Frequency: Always Evidence: Message shown but next action is ambiguous User could think they need to use My Goal panel before chat OR user could scroll and find chat input separately Likely cause: Initial instruction message doesn't explicitly guide user to either chat input or My Goal panel. Fix recommendation: Add visual indicator (arrow, highlight) pointing to either chat input or My Goal panel Clarify message: "You can set a goal in the panel on the right, or describe your needs in the chat below" Pre-scroll to show input field when new chat is created Acceptance test: New chat user immediately understands they can either use My Goal panel or chat input Chat input is visible without scrolling Goal-setting flow is clear ID: W-011 Severity: Low Category: Layout Area: Chat / Message display Steps to reproduce: Send message with special characters and emoji to chat Message appears as user bubble Observe emoji rendering Expected: Special characters and emoji should render correctly Actual: Special characters (! @ # $ % ^ & * ()) and emoji (🎉🚀💼) render correctly and preserve formatting. This is WORKING CORRECTLY. Frequency: Always Evidence: Message: "Test with special chars: !@#$%^&*() and emoji 🎉🚀💼" sends successfully All characters preserved in both message input and sent bubble Emoji display is crisp and correct Likely cause: N/A - feature works correctly Fix recommendation: No fix needed. This is a strength. Acceptance test: Special characters and emoji can be used in chat Characters are preserved without corruption Display quality is good ID: W-012 Severity: Low Category: Other Area: Customer management / Data persistence Steps to reproduce: Go to Customers page Click Edit on first customer (Broadtown Brewery) Fill Primary Contact Name: "John Smith" Click Update Success message shows Press F5 to refresh page Check if "John Smith" is still in Contact column Expected: Contact name should persist after page refresh Actual: Contact name "John Smith" is still displayed in table after page refresh. Data persistence works correctly. Frequency: Always Evidence: Edit successful: "Customer updated successfully" message Table shows updated contact name Page refresh preserves the change Backend is saving data correctly Likely cause: N/A - feature works correctly Fix recommendation: No fix needed. This is a strength. Data persistence is working. Acceptance test: Customer edits save to backend Changes persist across page refreshes No data loss on navigation ID: W-013 Severity: Low Category: UX confusion Area: CRM Dashboard / Empty states Steps to reproduce: Go to CRM

Dashboard Observe metric cards and task sections Expected: Empty states should be clear and helpful Actual: Empty states are clear: "No upcoming tasks" with checkmark icon "No overdue tasks" with checkmark icon Dashboard metrics show: 0 orders, £0.00 revenue, 0 overdue tasks Frequency: Always Evidence: Icons are appropriate (checkmark = good = no tasks needed) Text is clear and reassuring Metrics are accurate (0 of everything is consistent) Likely cause: N/A - UX is good Fix recommendation: No fix needed. Empty states are well-designed. Acceptance test: Empty states use appropriate icons and messaging User understands state is good, not an error C) REGRESSION TEST SCRIPT Navigation & Core Features 1. Verify Leads page loads data (or shows graceful offline message) without error 2. Verify Nudges page loads suggestions (or shows graceful offline message) without error 3. Verify Account page allows logged-in user to view profile without "Sign in required" message 4. Verify chat does not create duplicate plan messages when user requests plan 5. Verify Send button is disabled while plan is being generated (prevent double-submit) Customer Management 6. Go to Customers page and click Edit on any customer 7. Fill Primary Contact Name field with "Test Contact" 8. Click Update button 9. Verify success message appears 10. Refresh page (F5) 11. Verify Contact field still shows "Test Contact" Orders & Calculations 12. Go to Orders page and click "Add Order" 13. Try to submit without filling any fields 14. Verify validation errors show for Order Number and Customer fields 15. Click Cancel to close modal 16. Verify Products have realistic prices (not £0.00) 17. Create a new order with valid data and check that totals calculate correctly 18. Verify Order subtotal, VAT, and total are calculated accurately based on line items Data Integrity 19. Check Dashboard metrics: customer count, order count, revenue total 20. Verify counts match actual data (no off-by-one errors) 21. Check Tasks page tab counts: Upcoming, Overdue, Completed match displayed items Special Character & Emoji Support 22. Send chat message with special characters: !@#$%^&*() 23. Send chat message with emoji: 🎉🚀💼 24. Verify characters render correctly in message bubble Empty States & UX 25. Verify Events "No Upcoming Events" message is clear and helpful 26. Verify Tasks "No tasks here!" empty state is clear 27. Verify Orders "No orders found" message is helpful Form Validation 28. Test Order creation with invalid/missing data - should show validation errors 29. Test Customer edit with blank Primary Contact - should save (field is optional) 30. Verify modal dismissal (X button or Cancel) works and doesn't save changes D) BUTTON COVERAGE LOG Home/Chat Page Standard (mode toggle) - Button functional, shows active state MEGA (mode toggle) - Button functional, clickable Activity log - Button present, not tested (click would show activity) Quick actions - Button present, not tested (would show action menu) Send message - Button functional, messages send successfully Save goal - Button present in My Goals panel, not tested (would save goal) CRM Dashboard Dashboard tab - Loads successfully, shows metrics and charts Products - Page loads, table displays correctly Customers - Page loads, table displays, data editable Suppliers - Not tested (page not visited) Orders - Page loads, "Add Order" button functional, opens modal Delivery Runs - Not tested Routes - Not tested Bases - Not tested Stock - Not tested Sales Diary - Not tested Tasks - Page loads, shows task counts and list correctly Activities - Not tested Events - Page loads, shows empty state, "Configure Discovery" button present Review Queue - Not tested Settings - Not tested Order Modal (Add Order) Order Number field - Text input functional Customer dropdown - "Select customer" dropdown present, not tested (would open dropdown) Status dropdown - "Draft" selected by default Delivery Run dropdown - "No delivery run" selected, optional field Currency dropdown -

"GBP (£)" selected Notes textarea - Text input functional, optional Product selector (line items) - Dropdown present, not selected Quantity field - Default "1", number input functional Unit Price field - Default "0", number input functional VAT Rate dropdown - "20% (Standard)" selected Add Line Item - Button present, not tested (would add line) Discount Type dropdown - "No Discount" selected Discount Amount - Field shows "0", optional Shipping field - Field shows "0", optional Shipping VAT Rate - "20%" selected Cancel button - Button functional, closes modal without saving Create Order button - Button tested for validation (correctly shows errors), not tested for successful creation Customer Modal (Edit Customer) Customer Name field - Pre-filled "Broadtown Brewery", editable but appears locked in form Primary Contact Name - Empty field, tested with "John Smith", saved successfully Email field - Empty, has reload icon Phone field - Empty Address Line 1 - Pre-filled "29 Broad Town Road" Address Line 2 - Empty City - Pre-filled "Swindon" Postcode - Pre-filled "SN4 7RB" Country - Pre-filled "GBR" Notes - Textarea, empty View Orders button - Present, not tested Cancel button - Functional, closes modal Update button - Functional, saves changes and shows "Customer updated successfully" Other Pages New Chat - Button functional, creates new chat session Previous Chats - Expandable menu, not tested Account - Page loads with "Sign in required" error (BLOCKER) Pricing - Page loads with full pricing table Leads - Page loads with Supabase error (BLOCKER) Nudges - Page loads with Supabase error (BLOCKER) Events - Page loads, "Configure Discovery" button present Tasks - Page loads, "New Task" button present (not tested) Not Tested (Due to Time or Missing Data) Previous Chats - Would require existing chat history Suppliers management (add, edit, delete) Delivery Runs creation and management Routes feature Bases feature Stock management Sales Diary functionality Activities tracking Review Queue functionality Integration configuration Settings pages Memory Debug feature Try Demo Mode button Reddit/Hacker News discovery sources SUMMARY The Wyshbone application has solid core functionality for CRM management (customers, orders, tasks) with good data persistence and proper form validation. However, two critical blockers prevent full feature testing: Supabase misconfiguration blocks the Leads and Nudges features entirely Auth state issue blocks Account page access These must be fixed before the app can be considered production-ready. Additionally, demo data with zero prices creates unrealistic testing conditions for order calculations. The UI is generally clean and intuitive, with good empty states and responsive forms. The special character and emoji support works flawlessly.

HONEST PRODUCT EVALUATION: WYSHBONE First impression This is a conversational AI assistant trying to be a comprehensive B2B sales platform for niche industries (breweries, pubs, dental practices, etc.). It promises lead generation, market research, email drafting, and CRM integration. It's positioned as an AI "sales agent" for small business owners, particularly in vertical markets. The execution is half-baked and the product has confused identity. Value gap What it promises: AI-powered lead generation and research ("find leads, research markets, draft emails") Smart nudging to follow up with contacts Integration with existing CRM and business operations (Events, Suppliers, Orders, etc.) Industry-specific intelligence (beer festivals, trade shows) A unified "Agent's Workspace" to manage everything What it actually delivers: A chat interface that can generate templated emails and sometimes find leads (when demo mode is

enabled) Fragmented features that mostly fail due to missing database configuration (Supabase not set up) Generic lead generation that's location-based but not truly intelligent (returned leads outside the requested area) An elaborate CRM interface that's completely empty and non-functional An unsolved problem: what does this product actually do better than Perplexity + ChatGPT + a real CRM? Friction points Critical blocker: Database not configured. Leads, Nudges, and half the app fail with "Supabase not configured" errors. This suggests the deployment is incomplete or the product isn't meant to work without user setup. Infinite loading on core tasks. The "Find me restaurants in London that serve craft beer" request hung on "Searching for leads..." for 30+ seconds with no indication of progress, error, or timeout. Demo mode is a requirement, not an option. The real database is broken, so you can't even evaluate the product properly without activating demo mode. This should be obvious upfront. Confusing goal-setting flow. There are three different places to set goals: the right sidebar "My Goals" panel, the chat interface, and a "Start Working On This Goal" button. It's unclear which one actually matters or how they relate. Results have wrong locations. Asked for restaurants in London, got results in Newcastle, Durham, and one in London. The matching logic is opaque and seems to ignore location constraints. "Location suggestions" feature is broken. A dropdown appeared with "Failed to load location suggestions" in red, making the form feel unfinished. Unclear what "Standard" vs "MEGA" vs "Conversational" modes do. Three different mode toggles at the bottom of the chat, no explanation of what changes between them. The email templates use generic placeholders. Promised personalization, but the email template is basically a madlib with [First Name], [Your Name], [Company], etc. Not smart enough to differentiate based on the pub type or location. Fragmented navigation. Jumping between Chat, Leads, Nudges, Events, Reviews, etc. doesn't feel like a cohesive product—it feels like multiple half-finished features bolted together. No clear export or next-step path. After getting a lead or email template, there's nowhere obvious to "do something" with it. No copy-to-clipboard, no "add to CRM," no integration hints. Missed opportunities Auto-enrich leads with real data. The 3 results shown had names, addresses, emails, and phone numbers—great! But there's no way to see why each was matched, what % likelihood they actually sell craft beer, or business intelligence (revenue, growth, similar customers). Turn results into actionable workflows. Don't just show leads—suggest next steps: "Email these 3 leads using this template, then check back in 5 days." Actually make it a plan, not a list. Integrated lead qualification. Instead of dumping raw leads, ask clarifying questions: "Is this decision-maker the right person to contact?" "What's your budget?" "How many months until purchase?" Then rank results. Vertical-specific intelligence. The app knows it's targeting breweries, but the results and templates are painfully generic. Where are insights like "gastropubs with craft beer selections grew 23% YoY" or "these 3 pubs recently hired a beverage director"? Progress indication on long tasks. The "Searching for leads..." spinner should show "Checking 50 venues... Found 3 matches... Retrieving contact info..." Real agents show their work. API-first design for power users. Small business owners who use Zapier, Make.com, or their own tools are locked out. Should be easy to export leads as CSV, connect to Pipedrive, or trigger workflows. Batch operations. Generate 50 emails, send them all at once with tracking. Right now, it feels one-off and manual. Proof of value upfront. Show me a demo of a brewery owner who used this to actually close a deal. Give me a case study, metrics, testimonials. Right now it's vaporware. Pricing clarity. £35–£250/month for different "monitors" and "deep research runs"—what does that mean? No explanation of how

charges are calculated or what you get at each tier. Social proof and onboarding. No "here's how real users are using this" walkthrough, no success stories, no industry benchmarks. Quick leverage (10 changes that would dramatically improve this) Fix the database configuration. This is not optional. Either auto-configure Supabase on signup or provide clear, one-click setup. Show progress during lead search. Replace the indeterminate spinner with: "Searching 250 venues in London... Found 8 potential matches... Verifying contact info..." Make the AI's thinking visible. Add lead confidence scores. Show "85% match: This venue has craft beer on menu" with sources and reasoning, not just a percentage. Unify goal-setting. Remove the confusing triple-goal-setup. One input field, one "Start" button. Pick the best UX and stick with it. Template personalization that actually works. Instead of placeholders, ask "What's your role at the brewery?" and auto-fill the email. Or parse the company name from the lead data. Fix location filtering. Make the location dropdowns work. If someone asks for "London," return London results or ask "Did you mean East London? Or Greater London region?" Create a "Plan" view. Convert results into a weekly action plan: "Week 1: Contact these 5 leads. Week 2: Follow up. Week 3: Qualify." Make it a system, not a chatbot. One-click CRM export. Add buttons: "Export to Pipedrive," "Export to Salesforce," "Send to Mailchimp," "Copy email list." This is table stakes. Simplify pricing. Replace "monitors," "deep research runs," and "API credits" with plain language: "Find 50 leads/month" (Basic), "Find 200 leads/month" (Pro). Users don't understand tokens. Kill the unused features. Events, Suppliers, Orders, Delivery Runs—these feel like copy-paste from a different product. Focus on leads, research, and email. Do three things brilliantly, not ten things poorly. Strategic read This feels like a proof-of-concept that escaped into production. The core AI research engine works (it can generate emails and find some leads), but the product layer is unfinished: broken database, fragmented UI, unclear value prop, and unclear who actually uses this or why it's better than hiring a sales person or using ChatGPT + LinkedIn. It's trying to be both a lead-gen tool and a full CRM, which dilutes its focus. If the team focuses ruthlessly on leads + email templates + integrations, it could be useful. But right now it's a prototype with a price tag. I would not use this daily as a brewery owner. I'd use ChatGPT and a LinkedIn recruiter tool instead, and pocket the £35–£250/month.

Replit Build Instruction: Wyshbone Core Fix

You are working on Wyshbone. Your job is not to add features. Your job is to make the existing system truthful and usable.

You have two inputs above:

1. A QA defect report showing broken features

2. A product evaluation showing that the system feels fake and fragmented

Treat those reports as ground truth.

Your priorities, in strict order:

1. Make the system real

- Leads and Nudges must load from Supabase OR show a clear demo fallback
- Never show raw technical errors like “Supabase not configured” to users
- Auth must be unified so Account, CRM, Leads, Nudges all agree on login state
- Plan creation must be idempotent: one click creates one plan and one completion message

Stop and do not proceed until:

- Leads loads
- Nudges loads
- Account loads
- No duplicate plan messages appear

2. Make the agent visible

- Replace “Searching for leads…” spinners with progress updates
- Show what is being checked, how many venues, and why a lead was selected

3. Make the goal and plan flow singular

- Remove or hide multiple goal inputs
- One clear place to define “what I want”
- One visible plan that drives the UI

4. Make outputs actionable

- Add copy, export, or send actions to leads and emails
- Outputs must connect to CRM or be downloadable

Do NOT:

- Add new CRM modules
- Expand Events, Routes, Stock, etc
- Build features unrelated to leads, plans, or agent execution

Your job is to make Wyshbone feel like a working autonomous sales agent, not a generic SaaS dashboard.

Before making any changes, summarise back to me what you will fix first, in order, and what you will explicitly not touch.
